Don't buy a new thermostat until you try this. Yours Should Look Like This Follow these steps and this should work. It did for me. If it doesn't work, you were going to end up buying a new thermostat anyway. I have some recommendations at the bottom of this post if it doesn't work. Read the more in depth description that proceeds this list so I can help you (not prevent you) from breaking something. Remove thermostat from the wallRemove batteries from the back of thermostatGently pry the cover off the frontRemove the screen and circuit boardVery gently pull the two ribbons from the boardReinstall the two ribbons and reassemble the stat Removing The 8000 Pro From The Wall As long as your thermostat is firmly mounted to the wall this will be an easy task. Grasp the thermostat with both hands, one on each side of the stat. This works best if you pull from the bottom or the top. Either one works well. The stat should come off the base with a firm pull. If that works, go to the next step. If the installer mounted the stat to the sheet rock only, the base may come off the wall. Don't worry. This is a good time to fix that. But let's see if we can fix the stat first. On the top and bottom of the stat in the middle are indentations. Just pry the base from the stat. Remove The Batteries From The Thermostat I guess it's okay if you don't because in the next step they will just fall out anyway. Notice the steel prongs in the middle. Ten of them. Make sure these don't get out of alignment or bent. If these prongs get bent it will be very difficult to put the thermostat back on the wall because the won't line up with the connections on the base. Gently Pry The Cover Off The Front I was able to put my thumb nails under the outside edges of the cover and pop the cover loose. Once even one side comes free from the main body it's relatively easy to work the rest of the cover free from the base. The plastic in these stats is really strong stuff and I don't think you can break it by using your finger nails or even a small screw driver. I realize not every one has the right finger nails to do this. Using tools could leave small abrasions on the plastic, but that's not a serious thing to worry about. Work at it and it will come off. Remove The Screen And The Circuit Board While holding the stat and looking into the screen, notice the tabs that slightly latch over the circuit board. With your thumbs, pull back the tabs and if you can simultaneously reach your fingers around the back in the middle, pop the circuit board out of its holder. Now it gets a little more delicate. Very Gently Pull The Two Ribbons From The Board This is the fix. Removing the ribbons and replacing them solved the problem. Probably a poor connection that improved by just pulling the ribbon out and replacing it into it's socket. Finding a small pair of needle nose pliers was very helpful. I tried several other methods that seemed just a little scary. Before I attempted to use the pliers, I put some electrical tape on the inside to cushion the contact of the pliers to the ribbon. With a little coaxing the ribbons came loose. Trying to replace the ribbons with my fingers was not going to happen. The pliers again were the answer. You can feel the ribbon sort of pop into place as you kindly work at it back and forth into the socket. I'm not sure which of the two ribbons was or would be the culprit that had the poor connection. It didn't seem to matter. The ribbon with the most slack was the easiest to R&R. I imagine if you have come this far then your are quite capable of the reassembly. We all have our favorites and Honeywell is one of mine. There was a time when I could have taken a hammer to a few of the older models when it came to programming schedules but that day has gone and that process is much easier. I have two stats that I like the most. One is more of a budget model, but that doesn't cut it any slack. It's a great control. It's Honeywell's T6 Pro available on Amazon My all time favorite is the 8000 Pro. I have two of them. One at my cabin that's WiFi so we can warm it up before we go and one in our residence to monitor what's going on while we're away. Sort of see what the outside temp is an such. This is also available at Amazon. Imagine that. Sorry about the image it's not as good as the T6. You can click on the image or just click here to check out the products and prices. Be sure to match the thermostat to the equipment you have. The part to look for is how many heats and how many cools. The stats are very versatile and can run almost anything from oil furnaces to gas or heat pumps. Auf Wiedersehen link to Can I Paint My Ductless Mini Split? link to Should HVAC Companies Hire Felons? If your thermostat is wired directly into your home's electrical system, a blank screen indicates there is no power going to the unit, which means there may be a tripped breaker or a problem with the wiring. ... If this doesn't resolve the issue, have the thermostat replaced. I have a Honeywell TH8110U1003 that is not responding to touch. RobotPoweredHome is reader-supported.
